

Carbon Filtration Systems

We offer a complete line of carbon filtration to customize any application: individual sinks, whole home filtration, and tank style units. Our carbon is made from high performance coconut shell that removes chlorine/chloramines (taste & odor), dissolved organics, VOC's, and synthetic pesticides down to 5 microns.

Whole Home Filtration: This unit is made by  **PENTAIR** and is available in 10" and 20" sizes. It is installed to your homes main line to provide quality water to your entire house. A 2 stage version is available with the 1st stage for sediment (dirt, sand, silt, and rust) and the 2nd stage for carbon. For individual sinks a smaller version is available.

Up Flow Tank Unit: This tank style unit has an inlet and outlet port that allows water to flow freely through the carbon media. Best for high flow applications where a drain is not available. Carbon media last approx. 500,000 gallons or 3-5 years before media needs replacing.

Backwashing Tank Unit: This unit uses a  **Clack** control valve and rinses the undesirable contents down the drain to increase the performance and the life span of the carbon media. Best for high usage applications where a drain is available. Carbon media lasts approx. 1 -1.5 million gallons or 5-7 years.

Filter options are determined by application needs, water test results, house size, number of people in home, well/city water, etc. Clarity Water Services will recommend correct filter application based on customer information.
